

CardSecure by CardConnect is your one-stop solution for payment security simplicity.

Our patented encryption and tokenization technology keeps your sensitive data safe while removing your company from PCI scope.

HOW IT WORKS

Encryption + Tokenization Immediately upon receiving the credit card number, CardSecure encrypts the sensitive data using Point-to-Point Encryption (P2PE). The encrypted card number is then assigned a secure token. The token—which is useless to hackers—is stored in your system, not the card information, so your sensitive data is completely safe.

Vault Storage When you use CardSecure, your system will never be in contact with any sensitive data. Once card numbers are encrypted they will be stored in our 100% PCI compliant facility. Your customers will be safe from the threat of identity theft, and you'll be free from PCI audits.

SEAMLESS INTEGRATION

You don't have to modify your current payment processing system to use CardSecure. Integrate it quickly and easily while maintaining your system.

PATENTED TECHNOLOGY

Our newly patented encryption/tokenization technology is the best on the market and ensures you and your customers absolute security.

INSTANT PCI COMPLIANCE

Meet industry standards without delegating hours of work each day to staying compliant. Never suffer through an expensive audit again.

CardSecure takes payment protection to a new level.
